THE CODES AND EXPLINATIONS

% First let's assign some constants we will use

%amplitude has choosen to be 1 and since matlab is making it difficult to work with non-integer values for conditional statements let's make T=100

```
T = 100;
A = 1;
t=linspace(0,T-1,T);
% Now let's define the components of the recieved signal at the input of the filter
st1=zeros(0,T);
for i = 1 : T/2
  st1(i) = A*sin((2*pi*i)/T);
 endfor
st2=zeros(0,T);
for i = T/2 : T
  st2(i) = A*sin((2*pi*(i-T/2))/T);
```

```
st1(i) = 0;
        endfor
       % Now let's calculate the a1 and a2 components of the z
       a1 = trapz(t,st1.*st1);
       a2 = trapz(t,-st2.*st2);
       %This communication system tends to reach minimal BER (around 10^-9) around 23 dB
       SNRdb = Iinspace(0,23,24);
       %This next section calculates the energy of the recieved signal
       Es1=trapz(t,abs(st1.*st1));
       Es2=trapz(t,abs(st2.*st2));
       Eb=Es1*(1/3) + Es2*(2/3);
       % Impulse response and the energy of the matching filter
       ht = st1(T-t) - st2(T-t);
       Eh=trapz(t,abs(ht.*ht));
       % Now lets calculate Noise power , the desicion treshold and parameters necessary for
probabilistic functions
       N0=Eb.*10.^(-SNRdb/10);
       sigmasquared = (N0/2)*Eh;
```

```
sigma = sigmasquared.^(1/2);
        treshold = (sigmasquared/(a1-a2))*(log((2/3)/(1/3))) + (a1+a2)/2;
        %Now lets find the BER theoratically.
        %The matlab is giving me some problems with the communications librariy so i am calculating the
Q function with the help of erfc
        BERtheory3=zeros(0,length(SNRdb));
        for i=1 : length(SNRdb)
         BERtheory3(i)=
                               (1-((1/2)*erfc(((treshold(i)-a1)/(sigma(i)))/2.^1/2)))*(1/3)
((1/2)*erfc(((treshold(i)-a2)/(sigma(i)))/2.^1/2))*(2/3);
        endfor
        Α
        %For the simulation let's create a test input
        testinput = randi([0 1],10000000,1);
        testoutput = zeros(0,length(testinput));
```

```
% This loop scales the test output for a1 and a2 components
        for i = 1 : length(testinput)
         if testinput(i) == 1
         testoutput(i) = a1;
        elseif testinput(i) == 0
         testoutput(i) = a2;
         endif
         endfor
        %Now lets create AWGN
        n0i = randn(1,10000000);
        BERSim = zeros(0,length(SNRdb));
        z0=zeros(0,length(testinput));
        errorcount = 0;
        %This loop combines proper AWGN and the test output, finds the output of the desicion block
and calculates the simulated BER
        for i = 1 : length(SNRdb)
        errorcount = 0;
        alpha = ((2*NO(i)).^1/2);
        n0= n0i .* alpha;
```

```
noisytestoutput1= testoutput + n0;
for c = 1 : length(testoutput)
 if noisytestoutput1(c) > treshold
    z0(c) = 1;
  else
    z0(c) = 0;
 endif
 endfor
